

XtraCore+ longer duration against highly demanding climate

DSM's approach to innovation begins with end users in mind. Studies of the Patagonian environment determined that fish farmers could benefit from DSM's UHMWPE to protect their farms from predators in demanding climates.

Features:

The first and second layer of braided polyethylene (HDPE)

DSM UHMWPE, a fiber that is lightweight and more resistant to bites/cuts than steel

The core is a third inner layer of polyester filaments

Capacity to manufacture thicknesses of up to 8.5mm
Knots tightened by steam stretching (Steam Fixation)

Greater coefficient for friction, helping its duration against the adverse climate, highly demanding tides and currents and, above all, the attacks of wildlife.

Other fishing nets:

Twisted knotted nets

Muketsu twisted knotless nets

Knotless Raschel nets
